

The clinician-patient feedback loop

Pilot workflow | Clinician approval stays at the center of treatment guidance.

1

PATIENT / Share a session

Today -> Program -> completed, partial, or skipped -> symptom response, difficulty, and optional comment.

2

CLINICIAN / Review the evidence

Today inbox -> Since Last Visit -> goal progress, symptoms, exercise responses, and patient comments.

3

ENGINE v0.1 / Explain the suggestion

Use the recovered rules and assessed inputs. Show missing information, triggered rule, reasons, and limiting factor.

4

CLINICIAN / Decide and approve

Accept, modify, or reject; record the final decision and optional disagreement reason. Only approved guidance reaches the patient.

5

FOLLOW-UP / Learn from the response

Patient sees approved guidance and updated Program. Later feedback informs the next review and pilot evaluation.

Preview boundary: engine evaluation saving, message replies/history, program-change audit, and founder engine metrics await a separate database rollout. Existing feedback and approved guidance work.

No automatic treatment advice or continuous monitoring. Existing administrator access exceptions remain a rollout blocker.
